

How do you know if your files are safe?

Chances are the computer that contains your most vital business information at this moment is running a version of Microsoft Windows that has never been locked down and secured for you by an experienced IT professional.

True? Then it's likely to already be sharing your private information with strangers on the Internet without your knowledge. In fact, I can even show you how. Then, we can solve that problem.

Cliff Rhodenizer Jr., CNE, MCSE

#1. Unauthorized Access Can Cost You.

Security measures that may have been appropriate just a few years ago are no longer adequate against today's evolving threats and criminal tactics.

Additionally, recent changes in federal law states that executives can be held personally liable in some cases where regulatory compliance was not achieved, resulting in the loss or mishandling of their customers' personal information.

It's not just YOUR information at risk, it's all the information you could be held responsible for keeping safe.

Again, it's not expensive to secure your information... it's expensive NOT to.

#2. Being Unprepared Can Cost You.

It doesn't do you much good if your data backups perish along with your data. Or, if your old data can't be restored to your new systems.

Fire... flood... tornado... theft... or other disasters we can't anticipate are the reasons why you need more than just a backup of your files. You need a disaster recovery plan for your business.

Having a good disaster recovery plan is the cheapest insurance you can buy.

Contrary to what others may have told you, it really doesn't cost much to solve these problems.

In fact, it may even surprise you to learn that the answer in most cases is NOT for you to buy anything new. More often, it's to simply let us properly setup and configure what you have. Then, show you some better ideas for going forward.

You can find out what you really need to keep your information safe and it won't cost you a dime. Just call and ask for a free consultation with no obligation.
